

Instructions for Scoring MPQ Items from ESCS Data File

This document explains different scoring schemes for the 276-item Multidimensional Personality Questionnaire (MPQ), with a focus on MPQ data collected for the Eugene-Springfield Community Sample (ESCS) by researchers at the Oregon Research Institute (ORI). This data file is currently archived at the Harvard Dataverse as MPQ_items_scales.tab, <https://dataverse.harvard.edu/dataset.xhtml?persistentId=doi:10.7910/DVN/QGEBUB>.

MPQ_items_scales.tab is based on an archived copy of the data held at the Oregon Research Institute. It contains both item responses and scale scores. It is designed to replace the separate files containing item responses and scale scores that were originally archived at the Harvard Dataverse because the original files appeared to contain problems. The central problem was that applying a scoring key to the items in the item response file did not generate the corresponding scores in the scale score file. Also, applying a scoring key to the items in the item response file generated scores that did not show expected levels of Cronbach alpha reliability. Study of these problems revealed the following issues.

First, the order of items in the version of the MPQ that was administered to the Eugene-Springfield Community Sample by researchers at ORI differed from the standard order of items in the published MPQ. The table below shows the difference in item order (reverse-scored item numbers appear in red font):

ORI Item Order	Original Item Order	Scale	ORI Item Order	Original Item Order	Scale	ORI Item Order	Original Item Order	Scale	ORI Item Order	Original Item Order	Scale	ORI Item Order

The scoring key for the MPQ items scales.tab data file, listed below, refers to items in the order in which they were administered by ORI to the Eugene-Springfield Community Sample. Researchers who possess an official, published version of the MPQ items will have to use the table above to match items from the published version to the version administered by the Oregon Research Institute. Numbers next to the scale labels refer to the number of forward-scored (True response = 1 point) and reverse-scored (False response = 1 point) items in the scale. Reverse-scored items appear in red font.

Wellbeing (WB, 23 items) 22/1

m8, m28, m38, m46, m55, m69, m82, m95, m105, m117, m128, m136, m148, m155, m170, m182, m187, m202, m209, m223, m233, m243, m252

Social Potency (SP, 25 items) 17/8

m1, m15, m20, m29, m39, m49, m57, m70, m80, m91, m100, m112, m119, m131, m140, m150, m158, m167, m176, m189, m199, m210, m217, m228, m236

Achievement (AC, 20 items) 14/6

m10, m19, m30, m45, m64, m74, m84, m96, m107, m122, m133, m146, m157, m172, m181, m196, m206, m218, m231, m242

Social Closeness (SC, 21 items) 9/12

m4, m37, m50, m60, m68, m75, m87, m110, m121, m135, m156, m169, m179, m192, m203, m214, m226, m239, m251, m274, m276

Stress Reaction (SR, 23 items) 21/2

m3, m14, m22, m32, m40, m58, m67, m71, m81, m92, m102, m111, m123, m141, m151, m159, m171, m180, m190, m200, m221, m230, m240

Alienation (AL, 20 items) 18/2

m11, m24, m35, m47, m59, m78, m90, m104, m116, m129, m144, m154, m166, m183, m194, m204, m219, m232, m245, m250

Aggression (AG, 19 items) 16/3

m7, m17, m31, m53, m65, m73, m86, m98, m113, m127, m138, m149, m163, m175, m188, m201, m212, m227, m241

Control (CO, 24 items) 13/11

m2, m12, m21, m34, m43, m52, m63, m79, m89, m97, m109, m120, m130, m142, m152, m164, m173, m185, m195, m208, m216, m224, m238, m247

Harm Avoidance (HA, 26 items) 12/14

m27, m62, m72, m99, m118, m137, m165, m193, m220, m253, m254, m255, m256, m257, m258, m259, m260, m261, m262, m263, m264, m265, m266, m267, m268, m269

Traditionalism (TR, 27 items) 22/5

m9, m16, m25, m36, m44, m51, m76, m83, m94, m103, m114, m124, m134, m143, m160, m178, m186, m207, m213, m225, m234, m246, m270, m271, m272, m273, m275

Absorption (AB, 34 items) 34/0

m5, m13, m18, m26, m33, m41, m48, m54, m61, m66, m77, m85, m93, m101, m108, m115, m125, m132, m139, m147, m153, m161, m168, m174, m184, m191, m198, m205, m211, m222, m229, m237, m244, m24

Wellbeing Abbreviated (11 items)

m28, m38, m46, m55, m105, m148, m155, m170, m182, m209, m243

Stress Reaction Abbreviated (14 items)

m3, m14, m32, m40, m71, m81, m102, m111, m141, m171, m190, m221, m230, m240

Unlikely Virtues (14 items) 7/7

m6, m23, m42, m56, m88, m106, m126, m145, m162, m177, m197, m215, m235, m248

Scoring Item Responses and Handling Missing Values

There are two response options for each item in the MPQ, (a) or (b). For most items, (a) and (b) refer to a True response or False response, respectively. For some items, (a) and (b) refer to two possible phrases following the item stem. In every case, (a)-responses to items are recorded in the data file as 1 and (b)-responses are recorded as 2. Missing responses in the data file are recorded as 1.5 .

The standard instructions for computing scale scores and handling missing values are somewhat complex, especially for the special validity scales. However, researchers at the Oregon Research Institute apparently used a simpler, but non-standard scoring procedures. For starters, the range of scale scores in the data file appear to be twice the value that they should be. For example, scores on the 23-item Wellbeing scale range from 23 through 46 instead of 0 through 23.

Furthermore, the scale scores in the MPQ_items_scales.tab data file computed at the Oregon Research Institute did not follow the standard instructions for handling missing values. Instead, it appears that ORI researchers recoded missing values with a half-point, .5. Replacing missing item responses with .5 produces scores that are very close to the scale scores divided by two for most respondents.

Why the scale scores in the file appear to be twice the value they should be is a question lost to history. It is also unclear why recoding missing values as half a point produces scores that correspond exactly to the scores divided by two for most respondents but differ by 1 or 2 points for a few respondents. We researchers have no choice but to accept these ambiguities and make our own decisions about whether to accept the scale scores in the file as is (and dividing the scores by 2) or applying a scoring key to the item responses, either recoding missing values as .5 or using the standard, but more complex prorating procedure described below.

Standard Scoring Procedure for the Content Scales

The items for each scale are scored, added, and prorated for missing responses. To score, items that are marked "true" [that is, option (a) was chosen, indicated by a "1" in the data file] receive a score of one, unless they are "false"-keyed in which case they receive a score of one when marked "false" [that is, option (b) was chosen, indicated by a "2" in the data file]. To prorate scores when responses are missing [indicated by a "1.5" in the data file], add the scored items of the scale, divide by the number of valid responses [that is, the total number of items on the scale minus the number of missing responses], and multiply the result by the total number of items on the scale.

Standard Scoring Procedure for the Validity Scales

TRIN

The following item pairs, when both are keyed "true" receive a score of 1. If an item is missing, the entire pair is considered missing. The "true" pair scores are then summed and prorated for missing item-pairs (score divided by number of valid item-pairs then multiplied by number of total possible pairs-14).

4	214
251	276
17	98
19	119
52	173
60	192
64	157
250	225
84	107
91	199
152	195
1548	150
181	196
189	210

The following item pairs, when both are keyed "false" receive a score of -1. If an item is missing, the entire pair is considered missing. The "false" pair scores are then summed and prorated for missing item-pairs (score divided by number of valid item-pairs then multiplied by number of total possible pairs-19).

1	39
4	214
14	180
251	276
17	98
19	119
274	203
34	43
47	166
50	179
53	175
68	135
92	223
95	128
266	118
120	130
122	242
167	236
189	216

The final TRIN score is calculated by adding the sums of the prorated "true" and "false" pair scores.

VRIN

Each item-pair is scored such that if the responses are in the indicated direction, the pair receives a score of 1. In dealing with missing values, the following rules apply:

Direction		Response		Pair Scoring Decision
Not Equal (NE)		Either item missing		Missing Pair
F	T	F	Missing	Missing Pair
F	T	T	Missing	0
F	T	Missing	T	Missing Pair
F	T	Missing	F	0

Items	Direction	
1	131	NE
3	200	F T
4	192	NE
11	183	F T
14	230	F T
15	176	T F
252	202	NE
17	212	NE
19	196	F T
20	29	F T
21	130	NE
31	188	F T
32	171	T F
37	203	T F
39	236	T F
40	123	NE
45	107	T F
46	170	F T
47	59	F T
49	158	NE
50	169	T F
51	134	T F
52	295	F T
55	105	T F
60	214	T F
173	172	F T
67	190	T F
70	189	NE
74	181	NE
78	129	F T
80	112	F T
81	102	NE
84	231	NE
87	179	F T
93	222	F T
117	182	T F
120	238	F T
148	243	F T
152	64	NE

After each item-pair is scored, the scores are summed and prorated for missing item-pairs (score divided by the number of valid item pairs, multiplied by the total number of possible pairs-39).
